

Tools

The following tools developed by ISG.EE are freely available under the [GNU Public License \(GPL\)](#):

[ISG Toolchest](#) - System managers tend to accumulate countles little scripts in their ~/bin directories. A few years back we stopped doing that and created a standard for writing system management scripts. We call it ISG Toolchest. Here you can find all about this system as well as all the scripts we have written over the years.

[Postgrey](#) - Postfix Greylist Policy Server. For us this reduced spam by over 90%

[SEPP](#) - Software centrally stored on the server and shared via NFS for clients running Mac OS X, Solaris and Linux. A software distribution system that makes the distribution redundant.

[Template Tree II](#) - The post-installation system configuration tool that takes care of all the little adjustments necessary to bring a system from 'fresh install' to 'useful'.
